

From price negotiation to a controlled digital sales path.

The LLM converses. The deterministic backend makes the commercial decision.

Kopilotti Sales digitizes used-vehicle price negotiation without transferring commercial authority to the language model.

NOT A CHATBOT

1.10.2026

Natural-language interaction and the commercial decision are separate.

The language model may interpret and explain. Price and commercial outcome come from deterministic server-side policy.

IMPLEMENTED + TESTED

When ACCEPT becomes authoritative

In the opt-in core path, ACCEPT can create a PRICE_AGREED deal, agreed price, session binding, reservation, inventory lock, audit and outbox event inside one PostgreSQL transaction.

Built and tested in the repository. The core path is not automatically activated in the public demo and is not presented as production-verified.

The repository separates implemented behavior from production verification.

Engineering evidence is deliberately bounded: a mechanism that works in development does not become a production guarantee through marketing language.

NOT PRODUCTION-VERIFIED

PostgreSQL persistence

Negotiation and purchase sessions, idempotency records, decisions and audit events have PostgreSQL persistence paths.

NOT PRODUCTION-VERIFIED

Atomic vehicle reservation

The database prevents concurrent active reservations for the same vehicle. Decision, reservation and audit can share one transaction boundary.

NOT PRODUCTION-VERIFIED

Audit history

Application audit history is tenant-scoped and hash-chained. Triggers reject updates and deletes through the application audit path.

IMPLEMENTED + TESTED

Dealer summary API

An authenticated, dealership-scoped read-only API exposes agreed and review-needed negotiations without internal pricing boundaries or customer identity fields.

ENGINEERING EVIDENCE

Black-box evaluation

A separate HTTP/API harness runs a real local Sales process against disposable PostgreSQL and tests protocol and safety boundaries.

IMPLEMENTED + TESTED

Fail-closed boundaries

Stale policy, missing vehicle, mismatches or rule conflicts escalate instead of producing a guessed commercial decision.

Current test evidence also covers PostgreSQL atomicity and same-vehicle concurrency paths. This is engineering validation, not production certification.

Trust also comes from what the system does not claim to do.

Sales is intentionally kept separate from customer funds, financing decisions and unfinished integrations presented as production capabilities.

FUNDS

Kopilotti Sales does not receive, hold, transfer, settle or refund customer funds. Payment goes directly to the dealership.

FINANCING

Kopilotti Sales is not a lender and does not make financing or credit decisions.

INTEGRATIONS

VIS / Autovista and vehicle-history boundaries exist, but no live production connection or provider partnership is claimed.

DDN

Sales includes deterministic canonicalization and bounded adapter preparation. Live signer/quorum/trust verification remains roadmap work.

PILOT FIRST

Pilot first: prove value through a lightweight vehicle-specific negotiation path, then deepen DMS/CRM/marketplace and data integrations.
