Kopilotti Sales

Kopilotti Sales is a digital car salesperson and a sales channel for dealerships.

The language model does not decide the price.

Production-verified scope - 26 August 2026

Problem and value

- Vehicle information and other purchasing steps can be online while price negotiation still requires a manual exchange.
- Kopilotti Sales performs the selling task under the dealer's authority and agrees the price with the customer.
- The dealer defines the policy. The system applies it consistently.

How it works

1. The customer can proceed at the list price or negotiate.
2. Sales accepts a price on the dealer's behalf within its rules.
3. The agreed price and offer history are compiled for the dealership to process.
4. After the price is agreed, the dealership is responsible for the sales contract, signature, payment or financing, and vehicle handover.

Production-verified scope - 26 August 2026

- durable PostgreSQL storage of negotiation sessions in production
- tenant-scoped negotiation-session access
- database-enforced integrity for tenant relationships
- production schema and readiness gates
- backup-and-restore test passed before release

The verification applies only to the limited production scope listed above.

Commercial safety

- The dealer defines the commercial policy, including the price floor, target price, list price, round limits, and escalation rules.
- The LLM may support conversation but does not decide the price or commercial outcome.
- A person retains authority over exceptional cases.
- The same validated input and policy produce the same commercial decision.

Implemented and tested

- digital price negotiation
- deterministic `ACCEPT`, `COUNTER`, `REJECT`, and `ESCALATE` logic
- dealer-defined commercial boundaries and price-floor enforcement
- deterministic canonicalization and hash generation
- a safe local boundary for constructing and displaying a receipt link

Clear limits

Not production-verified

Reservation and audit mechanisms are implemented and tested but have not been production-verified in this review.

Note

A hash shows integrity-related consistency, not issuer identity or a trust chain.

Roadmap

live DDN verification | quorum verification and public anchoring | proof-gated execution

These are target or research directions, not current capabilities.
